2023

Subject Name:Data
Structure

Subject Code:

1. Aim/Overview of the practical:

i) Kingdom Of Fire and Ice

There is a kingdom in land of fire and ice known as westros. The kingdom is ruled by mad king Amen Targareyan. Further more Westros is divided into two territories. One territory known as ice because it is always snowing and other Fire beacuse of volcano near by area. There is rebellion to overthrow the mad king to bring peace to Westros. There is a secret attack on red fort by rebellion force lead by Luke Skywalker. There is snitch in rebellion force. He trades the secret attack plan to mad king. However mad king has superpower to sense disturbance in the force. He sends out his best knights to scout the rebellion force. He got to know that rebel force outmatch city guards one to hundred. Moreover he came to know that Luke is last jedi who can detroy him.In order to win this battle against rebels, the mad king decided to use N common folks as soldiers. He select a bunch of people from a territory and train them .Now king can only select odd number of people from land of fire and from land of ice in one go. He cannot select bunch of people consecutively from either territory.In how may ways the mad king could assemble his army to battle against rebel forces ? Note: The number of people in each territory is infinte

ii)

Chef has decided to go to a gold mine along with NN of his friends (thus, total $N+1$ people including Chef go to the gold mine). The gold mine contains a total of XX kg of gold. Every person has the capacity of carrying up $\text{atmost } YY$ kg of gold. Will Chef and his friends together be able to carry up all the gold from the gold mine assuming that they can go to the mine exactly once.

iii) The game of billiards involves two players knocking 3 balls around on a green baize table. Well, there

is more to it, but for our purposes this is sufficient. The game consists of several rounds and in each round both players obtain a score, based on how well they played. Once all the rounds have been played, the total score of each player is determined by adding up the scores in all the rounds and the player with the higher total score is declared the winner. The Siruseri Sports Club organises an annual billiards game where the top two players of Siruseri play against each other. The Manager of Siruseri Sports Club decided to add his own twist to the game by changing the rules for determining the winner. In his version, at the end of each round, the **cumulative score** for each player is calculated, and the leader and her current lead are found. Once all the rounds are over the player who had the maximum lead at the end of any round in the game is declared the winner.

Consider the following score sheet for a game with 5 rounds:

Round	Player 1	Player 2
1	140	82
2	89	134
3	90	110
4	112	106
5	88	90

The total scores of both players, the leader and the lead after each round for this game is given below:

Round	Player 1	Player 2	Leader	Lead
-------	----------	----------	--------	------

1	140	82	Player 1	58
2	229	216	Player 1	13
3	319	326	Player 2	7
4	431	432	Player 2	1
5	519	522	Player 2	3

Note that the above table contains the cumulative scores.

The winner of this game is Player 1 as he had the maximum lead (58 at the end of round 1) during the game.

Your task is to help the Manager find the winner and the winning lead. You may assume that the scores will be such that there will always be a single winner. That is, there are no ties.

iv) Given an integer N , let us consider a triangle of numbers of N lines in which a number a_{11} appears in the first line, two numbers a_{21} and a_{22} appear in the second line, three numbers a_{31} , a_{32} and a_{33} appear in the third line, etc. In general, i numbers $a_{i1}, a_{i2}, \dots, a_{ii}$ appear in the i^{th} line for all $1 \leq i \leq N$. Develop a program that will compute the largest of the sums of numbers that appear on the paths starting from the top towards the base, so that:

- on each path the next number is located on the row below, more precisely either directly below or below and one place to the right.

v) You are asked to calculate factorials of some small positive integers.

2. Steps for experiment/practical/Code:

```
i)
#include <stdio.h>

#include<inttypes.h>

void multiply(uint64_t F[2][2], uint64_t M[2][2],uint64_t k);
```

```
void power(uint64_t F[2][2], uint64_t n,uint64_t k);
```

```
uint64_t fib(uint64_t n,uint64_t k)
```

```
{  
    uint64_t F[2][2] = {{1,1},{1,0}};
```

```
    if (n == 0)
```

```
        return 0;
```

```
    power(F, n-1,k);
```

```
    return F[0][0];
```

```
}
```

```
void power(uint64_t F[2][2], uint64_t n,uint64_t k)
```

```
{
```

```
    if( n == 0 || n == 1)
```

```
return;
```

```
    uint64_t M[2][2] = {{1,1},{1,0}};
```

```
    power(F, n/2,k);
```

```
    multiply(F, F,k);
```

```
    if (n%2 != 0)
```

```
        multiply(F, M, k);
```

```
}
```

```
void multiply(uint64_t F[2][2], uint64_t M[2][2],uint64_t k)

{

    uint64_t x = (F[0][0]*M[0][0] + F[0][1]*M[1][0])%k;

    uint64_t y = (F[0][0]*M[0][1] + F[0][1]*M[1][1])%k;  uint64_t z =
(F[1][0]*M[0][0] + F[1][1]*M[1][0])%k;

    uint64_t w = (F[1][0]*M[0][1] + F[1][1]*M[1][1])%k;

    F[0][0] = x;

    F[0][1] = y;

    F[1][0] = z;

    F[1][1] = w;

}

int main()

{

    uint64_t n,k,t;

    scanf("%llu",&t);

    while(t--)

    {

        scanf("%llu",&n);

        scanf("%llu",&k);
```

```
printf("%llu\n", (2*fib(n,k))%k);
```

```
}
```

```
return 0;
```

```
}
```

ii)

```
#include <iostream> using  
namespace std;
```

```
int main() {  
    // your code goes here  
    int t;  
    cin>>t;  
    while(t--)  
    {  
        int n,x,y;  
        cin>>n>>x>>y;  
        if((n+1)*y>=x)  
            cout<<"YES"<<endl;    else  
            cout<<"NO"<<endl;  
    }  
    return 0;  
}
```

iii)

```
#include <iostream> #include<climits>  
using namespace std;
```

```
int main() {  
    int    n;  
    cin>>n;
```

```
int a1[n],a2[n],max1=INT_MIN,max2=INT_MIN,sum1=0,sum2=0;
for(int i=0;i<n;i++){      cin>>a1[i]>>a2[i];
sum1+=a1[i],sum2+=a2[i];    if(sum1>sum2){
    max1=max(max1,sum1-sum2);
}
if(sum1<sum2){
    max2=max(max2,sum2-sum1);
}
}
if(max1>max2){
    cout<<1<<" "<<max1<<endl;
}
if(max2>max1){
cout<<2<<" "<<max2<<endl;
}

return 0;
}
```

iv)

```
#include<bits/stdc++.h>
using namespace std; int
main(){
    int i,j,t,n;    cin>>t;
while(t--){      cin>>n;
int a[n][n];      for(int
i=0;i<n;i++){
for(j=0;j<=i;j++){
cin>>a[i][j];
}
}
for(int i=n-2;i>=0;i--){
for(j=0;j<=i;j++){
if((a[i][j]+a[i+1][j])>(a[i][j]+a[i+1][j+1]))
a[i][j]=a[i][j]+a[i+1][j];
else
```

```
        a[i][j]=a[i][j]+a[i+1][j+1];
    }
}
cout<<a[0][0]<<endl;
}
return 0;
}
```

v)

```
#include <bits/stdc++.h>
#include <boost/multiprecision/cpp_int.hpp>
#include <iostream> using namespace
std; using namespace
boost::multiprecision;

int main() {
    // your code goes
    here int t; cin>>t;
    while(t-->0)
    {
        int n;
        cin>>n;      cpp_int
        fact=1;      for(int
        i=n;i>0;i--)  fact=fact*i;
        cout<<fact<<endl;
    }

    return 0;
}
```

3. Observations/Discussions/ Complexity Analysis:

i)

The screenshot shows the CodeChef website interface for the 'Fire and Ice' problem. The browser tabs include WhatsApp, Fire and Ice - Problem, Gold Mining - Problem, The Lead Game - Problem, Sums in a Triangle - Problem, and Small factorials - Problem. The URL is codechef.com/problems/FICE?tab=submissions.

The problem page for 'Fire and Ice' (Difficulty Rating: NA) is displayed. The 'Submissions' tab is active, showing 'Others' Submissions' and 'My Submissions'.

iii)

The screenshot shows a web browser window displaying the CodeChef problem page for "The Lead Game". The page is in the "Submissions" tab, showing a list of explained codes with columns for ID, Result, Lang, Author, and Popularity. The list includes submissions from users like rahul2sharma, vikasverma07, ajeetmeena701, jogo_delta, and amoljp19. The right sidebar shows the problem solver badge progress (84/250), a status message "Status: Correct Answer" with submission ID 84178412, and a time of 0.01s. The bottom of the page shows a Windows taskbar with various icons and the system clock.

iv)

The screenshot shows a web browser window with multiple tabs. The active tab is 'codechef.com/problems/SUMTRI?tab=submissions'. The page displays the 'Sums in a Triangle' problem with a difficulty rating of 869. The 'Submissions' tab is selected, showing a list of submissions. The user's submission (ID: 84178608) is highlighted, showing a 'Correct Answer' status and a time of 0.10s. The page also includes a 'Problem Solver Badge' section showing a progress of 84/250 and a 'Next Problem' button. At the bottom, there are buttons for 'Compile & Run' and 'Submit Code'.
